

Aluminium Finishing

Powder Coating

Powder coating is the application of pigmented powder that once heat-cured, becomes a solid tough coating that adheres to the surface of aluminium. Our powder coat finishes come in a number of colours, lustres, textures, and special effects. Our standard colours come from the RAL colour chart (www.ralcolor.com).

Anodising

In addition to powder coating, our products can also come in an anodised finish. Anodising is an electro-chemical treatment of the aluminium that results in a hard and durable finish, while maintaining the metallic lustre of aluminium. Anodising is an integral finish that cannot flake, peel, or blister. Anodising is limited to finishes such as natural aluminium, bronze, and black, due to the process.
